YARA Rules to Identify Kwampirs Malware Employed in Ongoing Cyber Supply Chain Campaign Targeting Global Industries

Summary:

This is a re-release of FBI FLASH message (CP-000118-MW) previously disseminated on 05 February 2020.

The FBI has identified additional information regarding the Kwampirs Remote Access Trojan (RAT), which has targeted several global industries, including the software supply chain, healthcare, energy, and financial sectors. Software supply chain companies are believed to be targeted in order to gain access to the victim's strategic partners and/or customers, including entities that support Industrial Control Systems (ICS) for global energy generation, transmission, and distribution. The Kwampirs RAT has been observed by the FBI supporting targeted computer intrusions on these sectors, including supporting additional module execution on the targeted victim network, believed to enable follow-on computer network exploitation operations.

While the Kwampirs RAT has not been observed incorporating a wiper component, comparative forensic analysis has discovered the Kwampirs RAT as having numerous similarities with the data destruction malware Disttrack (commonly known as Shamoon). To assist with identification of the Kwampirs RAT, the FBI is providing five YARA rules, which produce consistent results on open source tools, such as Virus Total and Hybrid Analysis, for the Kwampirs RAT and Shamoon malware.

```

Recommended Actions Post-Infection:

If a Kwampirs RAT infection is detected, contact your IT mitigation and remediation company and coordinate your mitigation efforts with your local FBI field office. The following information would assist the FBI's investigation of this malware:

- Full capture of network traffic in PCAP format from the infected host(s) (48 hour capture).
- Full image and memory capture of infected host(s).
- Web proxy logs capture, to include cache of the Web proxy.
- DNS and firewall logs.
- Identification and description of host(s) communicating with the C2 (ex: server, workstation, other).
- Identification of patient zero and attack vector(s), if able.

Best Practices for Network Security and Defense:

- Employ regular updates to applications and the host operating system to ensure protection against known vulnerabilities.

- Establish, and backup offline, a “known good” version of the relevant server and a regular change-management policy to enable monitoring for alterations to servable content with a file integrity system.
- Employ user input validation to restrict local and remote file inclusion vulnerabilities.
- Implement a least-privileges policy on the Web server to:
 - Reduce adversaries’ ability to escalate privileges or pivot laterally to other hosts.
 - Control creation and execution of files in particular directories.
- If not already present, consider deploying a demilitarized zone (DMZ) between the Web-facing systems and corporate network. Limiting the interaction and logging traffic between the two provides a method to identify possible malicious activity.
- Ensure a secure configuration of Web servers. All unnecessary services and ports should be disabled or blocked. All necessary services and ports should be restricted where feasible. This can include whitelisting or blocking external access to administration panels and not using default login credentials.
- Use a reverse proxy or alternative service to restrict accessible URL paths to known legitimate ones.
- Conduct regular system and application vulnerability scans to establish areas of risk. While this method does not protect against zero-day attacks, it will highlight possible areas of concern.
- Deploy a Web application firewall and conduct regular virus signature checks, application fuzzing, code reviews, and server network analysis.

Reporting Notice:

The FBI encourages recipients of this document to report information concerning suspicious or criminal activity to their local FBI field office or the FBI’s 24/7 Cyber Watch (CyWatch). With regards to specific information that appears in this communication; the context, individual indicators, particularly those of a non-deterministic or ephemeral nature (such as filenames or IP addresses), may not be indicative of a compromise. Indicators should always be evaluated in light of your complete information security situation.

Field office contacts can be identified at www.fbi.gov/contact-us/field. CyWatch can be contacted by phone at (855) 292-3937 or by e-mail at CyWatch@fbi.gov. When available, each report submitted should include the date, time, location, type of activity, number of people, and type of equipment used for the activity, the name of the submitting company or organization, and a designated point of contact. Press inquiries should be directed to the FBI’s National Press Office at npo@fbi.gov or (202) 324-3691.
